INSTALLATION NOTES

(Pro-Drag 500mJ Series 4 systems)

MOUNTING

Mount the unit in a dry location away from intense heat and ensure bottom condensation slots are unobstructed and oriented to permit gravity drain. Ensure a source of cooling air is available.

Failure to use supplied rubber mounts will void warranty!

IGNITION LEADS

Use inductively suppressed spiral wound metal conductor ignition leads. The use of unsuppressed metal leads may cause electrical interference with ecu and/or ignition system.

Do not use carbon core leads!

SPARK PLUGS

Non resistor spark plugs will greatly enhance ignition performance <u>however</u> some installations will require the use of resistor spark plugs for correct ECU operation.

When using resistor spark plugs test internal resistance as part of regular maintenance!

Fixed gap surface discharge and semi surface discharge spark plugs are only suitable for naturally aspirated applications.

Keep spark plug gap <= 0.025" (0.6mm) for boosted motors to prevent coil and CDI damage!

INSULATION PRECAUTIONS

Degrease sparkplug insulators, sparkplug boots, ignition coil boots and installation tooling.

Use dielectric grease on sparkplug insulators and inside sparkplug and ignition coil boots.

POWER SUPPLY

REVERSE POLARITY WILL DAMAGE UNIT! ALWAYS INSTALL EXTERNAL FUSE!

Do not use voltage boosters, if the vehicle contains a PDM <u>use it only to control CDI switch wire</u>.

Connect ignition supply wires directly to battery!

When using a total loss electrical system install a 16V battery to ensure adequate voltage and isolate when charging.

WIRING

If required power/ground wire length exceeds recommendations use paired battery cable (power and ground) to make up distance. Do not rely on vehicle chassis to provide ground path.

Use twisted shielded pair wire for all power and coil connections such as aerospace M27500 series.

Keep coil primary wires well separated from HT leads, coil HV outlet, coil body and any ECU wiring!

TRIGGERING

For correct operation trigger voltage relative to CDI ground must rise above 3.2V and fall below 1.6V.

Single box: Ignition channels may be triggered in any sequence.

Two box: Firing sequence must alternate between boxes.

Trigger input & coil output letters (or numbers) indicate CDI firing sequence not cylinder number.

When provided with a trigger edge selection input the unit will default to falling (negative) edge trigger. To select rising edge (positive) trigger ground 'Trigger Edge' pin.

If uncertain lock Ecu timing and monitor engine with timing light while changing RPM. Timing should appear stationary with correct trigger edge.

POWER LEVEL SWITCH

To reduce ignition energy under low engine load conditions a power level switch is included.

Activate high power by grounding input through either a 'Hobbs' style manifold pressure switch or programmable output from the ECU when increased ignition energy is required.

Do not manually or permanently activate this feature!

TUNING

CDI performance is not affected by changes in dwell settings!

M&W CDI systems typically reduce combustion delay requiring a reduction in timing. The resulting changes in combustion characteristics may also require alterations to fuel flow.

Always set ECU ignition delay to zero and re-tune both fuel and timing curves after installation!

TACHO OUTPUT

Tacho output provides a 50% duty cycle square wave signal approximately 1V below supply voltage. This will work with most aftermarket digital tacho's however some earlier types and those designed for coil negative triggering may not read accurately and require an adaptor.

LED INDICATOR

After applying power to switch wire both the red and green LED's will illuminate for approximately 1 second.

The green led will then extinguish and flash briefly with each trigger event received

The red led will illuminate when high power mode is selected.

A repeated double flash may indicate a faulty ignition coil, faulty wiring, low supply voltage or damage to the CDI.

TESTING

The CDI may be tested by momentarily grounding the trigger inputs which will cause the LED to flash and corresponding ignition coil to spark.

Do not conduct this test without grounded spark plugs installed otherwise damage to the cdi and coil will occurr!

COIL SELECTION

Use only high quality cdi specific coils such as the M&W COI006.

Do not use with COP coils

Do not use with pencil coils

Do not use with ferrite core coils such as Mercury or Prufex

SPECIFICATIONS

Operating voltage
Startup voltage >= 7V
Maximum supply current 23A
Power off current < 700uA
Maximum ignition frequency 1,250 Hz (combined)
Energy limit:
Single spark 1,000 Hz (combined)
Coil primary voltage:
Low power 400V
High power 500V
Spark energy (per plug):
Low power
High power 500mJ
Trigger:
Current 10mA
Edge Adjustable
Voltage rising>= 3.2V
Voltage falling<= 1.6V
Tacho output:
Voltage Supply - 1.2V
Output current 100mA
Shape Square wave
Operating temperature <= 105°C
Dimensions 173L * 137W * 50H
Weight
Trongine minimum i,000gm (per box)
