INSTALLATION NOTES

(Pro-10e street systems only)

MOUNTING

Do not mount the unit where it will be exposed to liquids, ensure the bottom condensation slots are unobstructed and oriented to permit gravity drain. Select a location away from intense heat and if necessary provide a source of cooling air.

Failure to use supplied rubber mounts will void warranty!

IGNITION LEADS

Do not use unsuppressed metal or carbon core ignition leads!

Use inductively suppressed spiral wound metal conductor ignition leads such as those made by Magnecor www.magnecor.com.

SPARK PLUGS

Non resistor spark plugs will greatly enhance ignition performance however some installations will require the use of resistor spark plugs to eliminate electrical interference.

When using resistor plugs measure their resistance as part of regular maintenance. Open circuit or high resistance may cause damage to spark plug wires, ignition coils and CDI.

Fixed gap surface discharge and semi surface discharge spark plugs are only suitable for naturally aspirated applications!

INSULATION PRECAUTIONS

Degrease spark plug ceramic, coil/plug boots and installation tooling to prevent insulation breakdown.

Use of dielectric grease on spark plug ceramic and inside coil/plug boots will significantly increase insulation properties and ease installation/removal.

POWER SUPPLY

Do not use voltage boosters or connect through a PDM.

If wired to a power source shared with the ECU or its sensors erratic operation may be experienced!

When running a total loss electrical system install either a 16V or 18V battery to ensure adequate supply voltage.

WIRING

Wire ignition system directly to battery!

If required wire length exceeds recommendations use paired battery cable (power and ground) to make up distance. Do not rely on vehicle chassis to provide ground path.

Use twisted pair wire for all power and coil connections. For improved noise suppression and/or to comply with EMC requirements use twisted shielded wire similar to M27500 series.

M&W CDI systems will open circuit the external fuse under conditions of over voltage or reverse polarity. Faults such as loose battery terminals/wiring or defective alternator/regulator may also cause this to occur.

Main connector pins are designed to be roll crimped. Squeeze crimping or soldering will cause distortion possibly resulting in misfiring or incorrect CDI operation. Use of dielectric grease in main connector may reduce water ingress.

Keep coil primary wires well separated from HT leads, coil HV outlet, coil body and any input wiring!

TRIGGERING

For correct operation of ECU trigger (E) voltage relative to CDI ground must rise above 3.2V and fall below 1.6V. This input defaults to falling edge ignition. To select rising edge ignition install a jumper wire between 'Trigger edge' and 'Edge ground' input pins.

The Points Module trigger input (PM) is fixed rising edge for use with older points style distributors, where the ECU contains an in built igniter or it is not possible to remove the existing igniter.

Note! This input has a 100mA pull-up (trigger) current to prevent points oxidising and may not be suitable for all applications.

If the wrong trigger edge is selected ignition timing will be erratic and vary with rpm!

POWER LEVEL SWITCH

Some M&W Pro street systems are provided with a (active low) power level switch. Do not manually activate this feature or operate continuously as this will significantly increase spark plug wear and system current draw. Activate by grounding input through either a 'Hobbs' style manifold pressure switch or programmable output from the ECU when elevated energy levels are required.

TWO SPARK SWITCH

Some M&W Pro street systems are provided with a two spark switch. Do not manually activate this feature as it will significantly increase spark plug wear and double system current draw. Activate by grounding the input through a programmable ECU output.

Hi power and Two spark can not be used simultaneously!

TUNING

CDI systems are 'edge triggered' and not effected by changes in dwell settings.

M&W CDI systems may reduce combustion delay requiring a reduction in ignition timing. The resulting changes in combustion characteristics may also require alterations to fuel flow. Set ECU ignition delay to zero and tune engine as required.

Always re tune both fuel and timing curves after installing CDI ignition!

TACHO OUTPUT

The tacho output provides a 50% duty cycle square wave signal 1.2V below battery supply voltage. This will work with most aftermarket digital tacho's however earlier types and those designed for coil negative triggering may not read accurately.

LED INDICATOR

After applying power to input switch wire the LED will illuminate for approximately 1 second then extinguish. It will then flash briefly with each consecutive trigger event received. A repeated double flash of the LED may indicate a possible faulty ignition coil, faulty wiring, low supply voltage or damage to the CDI.

TESTING

The CDI may be tested by momentarily grounding the trigger inputs which will cause the LED to flash and corresponding ignition coil to spark.

Do not conduct this test without grounded spark plugs installed!

INSTALLATION PRECAUTIONS

The main cause of ignition damage is a high voltage flashover to ignition system wiring!

The fast rise time of CDI ignition output voltage increases the propensity for insulation breakdown in high voltage components therefore greater care must be taken with regards to cleanliness and wiring detail to prevent this occurring.

IGNITION COILS

(Pro-Street systems only)

COIL SELECTION

Most inductive ignition coils will work reasonably well with CDI systems however for ultimate ignition energy use a coil specifically designed for CDI use such as the M&W #COI006(A/T). Coils with in built drivers are not suitable for use with CDI ignition.

COP COILS

Some COP (coil on plug) coils designed for inductive ignition may contain a HV blocking diode in the secondary winding, see coil polarity notes below.

Use resistive spark plugs with all COP coils. Keep plug gap < 0.020" (0.5mm) to prevent coil damage. <u>DO NOT</u> use AEM pencil coils under any circumstances!

FERRITE CDI COILS

Ferrite core cdi coils provide high secondary current however they may not be suitable for all applications due to their extremely short arc duration. The high level of EMI emitted by these coils may also require additional shielding to prevent electrical interference

Do not use ferrite coils wired in parallel pairs!

Do not use 'Prufex' brand ferrite coils!

COIL POLARITY

All diagrams are shown for cdi style coils. For correct operation with inductive ignition coils wire the primary connections in reverse to maintain correct spark plug polarity.

CAUTION!

IGNITION DAMAGE MAY OCCUR IF OPERATED WITH AN EXCESSIVE SPARK GAP

2

CAUTION! HIGH VOLTAGE

DISCONNECT POWER BEFORE WORKING ON UNIT

VIEWED FROM BACK OF CONNECTOR

1 +12V (Battery)	Ground (Battery)	13 Power level (P)
2 +12V (Battery)	8 Ground (Battery)	14 Trigger (P/M)
3 Two spark (M)	Trigger edge	Trigger (E)
4 Tacho (T)	10 Edge ground	16 Ignition switch
5	11	17
6 Coil A +	12	18 Coil A -

SPECIFICATIONS

Operating voltage 12.5V> 18V DC
Polarity Negative ground
Startup voltage>= 6V
Maximum supply current 7.0A
Power off current < 700uA
Maximum ignition frequency 1,200Hz
Energy limit:
Single spark 700Hz
Hi power 550Hz
Twins park 350Hz
Coil primary voltage:
Standard power 460V
Hi power 540V
Spark energy:
Standard power115mJ
Hi power 150mJ
Trigger:
Current (E) 10mA
Current (PM) 10mA
Edge (E) Adjustable
Voltage rsisng >= 3.2V
Voltage falling <= 1.6V
Edge (PM) Rising
Tacho output:
Voltage Supply - 1.2V
Output current 100mA
Shape Square wave
Operating temperature <= 105°C
Dimensions 91L * 110W * 40H
Weight 500gm
